

### Two levels – Workspaces and Panels.

#### Workspaces

- contain arbitrary collections of Panels,
- are *renamable*,
- can be *added and removed*,
- can be *reduced to one or be numerous*,
- can be *limited to a maximum number*,
- can be *set to the current config by default*.

#### Panels

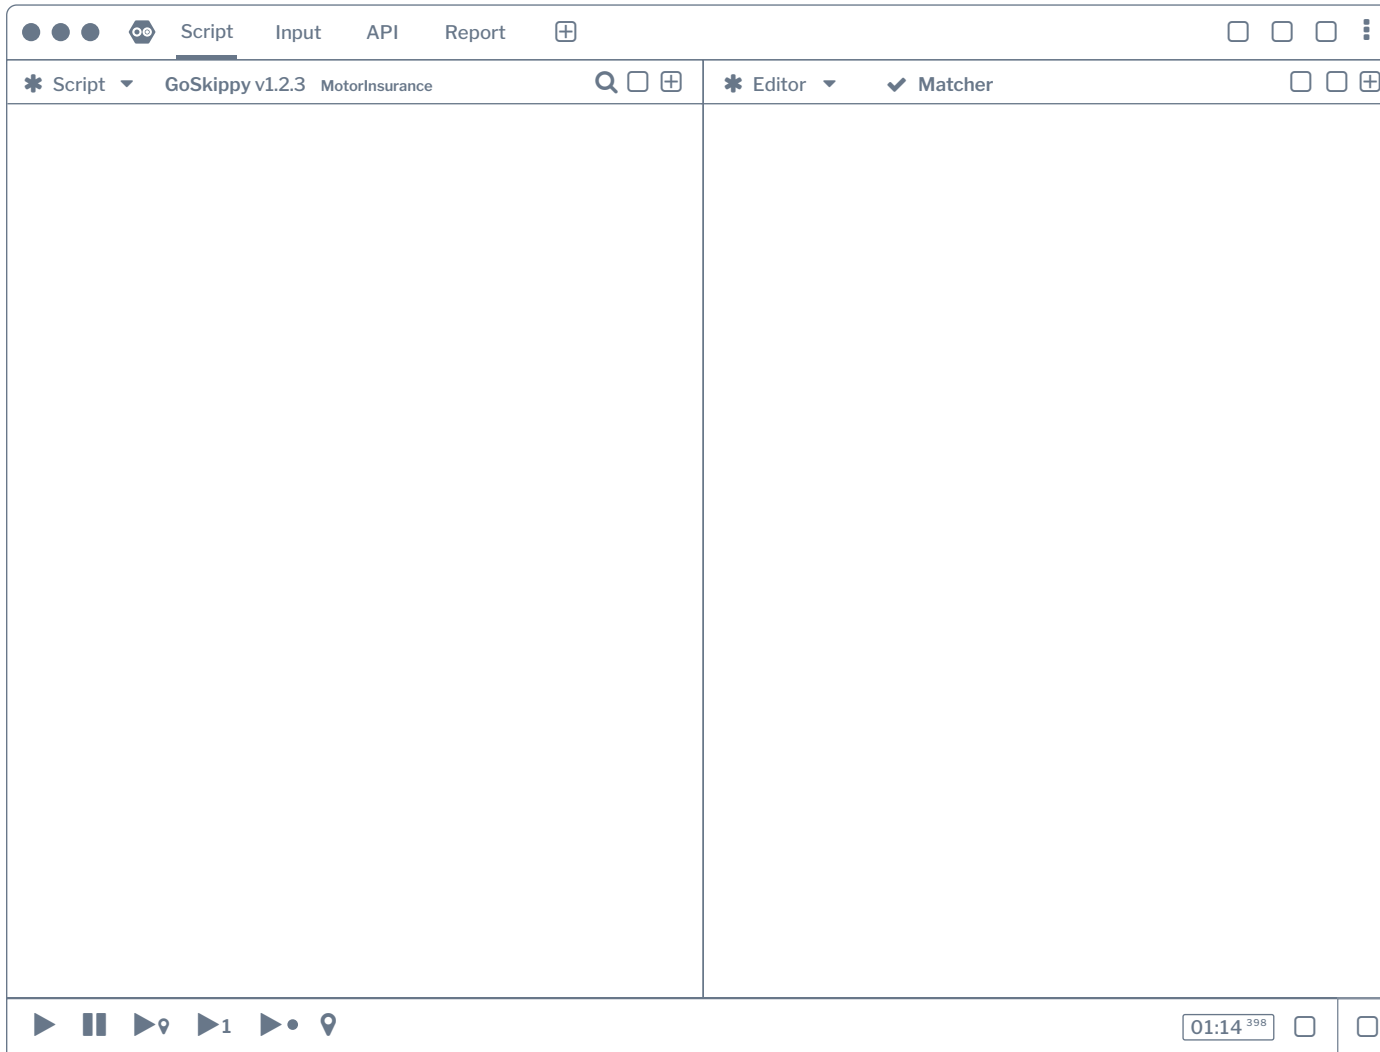

- contain app *functionality*,
- aren't *renamable*,
- can be *arranged horizontally or vertically within a Workspace*,
- can have *additional Panels arranged vertically or horizontally within themselves*,
- can be *dragged around screen*,
- can be *removed*,
- can have *titles (if applicable) next to tabs*,
- can have *individual controls (e.g. search)*
- can be *resized*

Note, naming is indicative.

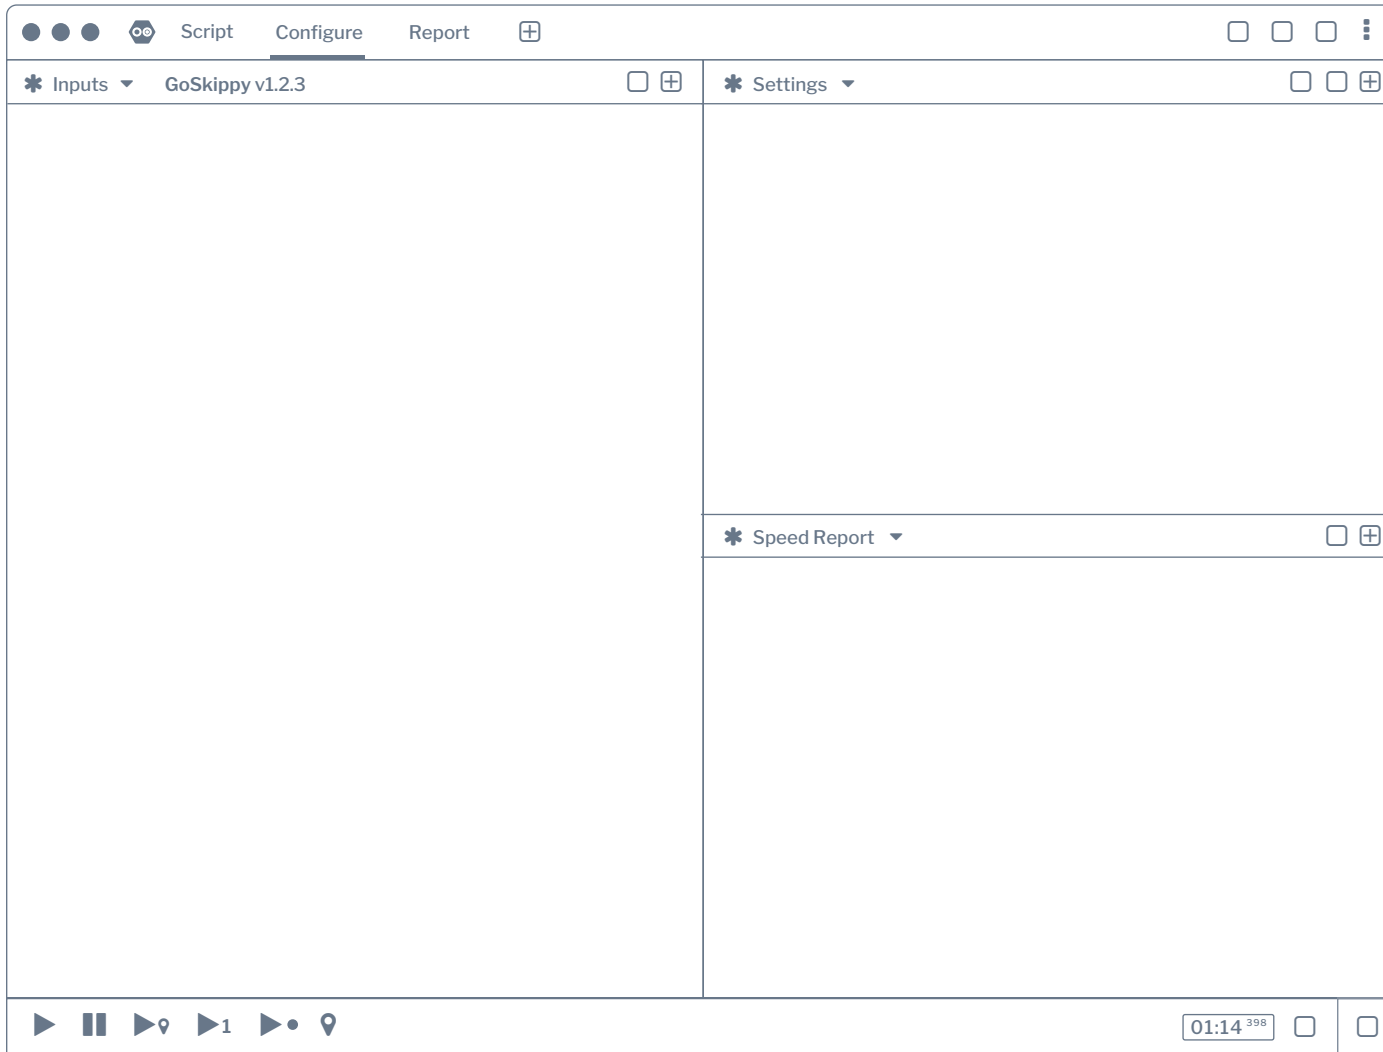

# Autopilot Application Framework Palette-based UI

Default setup = Current config

*The current setup can be emulated directly with Workspaces and Panels configured to match current Autopilot.*

*There will be additional Panel controls in the default setup.*

*Just one of numerous examples.*

*I imagine things like Inputs would be useful in a tabbed Panel along with the Editor.*
